

Lead Front End Developer Technical Test

Candidate Briefing Document

Role	Lead Front End Developer
Test Type	Practical / Take-home
Deadline	09:00 Monday 15 th June
Submission	Email or GitHub link

Overview

This test is designed to assess your ability to translate a visual design into a functional, well-structured frontend implementation. You will be provided with a reference Figma file and a JSON data file. Your task is to build the interface using that data. We are looking for clean code, good judgement, and attention to detail.

The Task

Using the supplied reference Figma and JSON file, build a working frontend that replicates the activity schedule interface shown. The application should:

- Render the weekly activity schedule using the provided JSON as its data source
 - Display all activity fields: time, name, location, type, spaces remaining, and booking status
 - Clearly differentiate between available and fully booked sessions (e.g. colour-coded badges as shown in the design)
 - Support day-by-day navigation, allowing the user to move between dates
 - Include a working activity type filter dropdown to narrow sessions by category
 - Make each activity card link through to its booking URL using the link field in the data
 - The implementation should be fully responsive and mobile first; there are no breakpoint designs included on purpose.
-

What to Submit

All development materials must be shared via email in with one of the following:

- ZIP containing all source files
- GitHub - share a link to a public repository

Your submission should include:

- All source code required to run the project
- A README.md with clear instructions on how to install dependencies and run the application locally

Tools & Technology

You are free to use whatever tools, frameworks, and libraries you wish. There is no prescribed stack - choose what you are most comfortable with or what you feel is best suited to the task.

How We Will Assess Your Submission

We will be looking at the following areas:

Area	What We Are Looking For
Visual Accuracy	How closely the implementation reflects the reference design in layout, hierarchy, and usability
Data Integration	Correct consumption of the JSON file — all fields rendered accurately with no hardcoded content
Code Quality	Readable, well-structured code with sensible component/file organisation
Functionality	Navigation, filtering, status badges, and booking links all work as expected
Responsiveness	The interface handles different screen sizes gracefully
README / Documentation	Clear setup instructions and any relevant notes on your approach

Supplied Assets

The following files are attached to this briefing:

- Timetables 1.fig
- activity-schedule.json

Questions & Deadline

If you have any questions about the brief, please reply to the email from which this document was sent. We are happy to clarify anything that is unclear.

Please submit your work by 09:00 Monday 15th June.
